

Realtime Data Assimilation & Prediction using ROMS

Brian Powell, Hernan Arango, Andrew Moore,
Emanuele Di Lorenzo, Ralph Milliff, and Dave Foley

Intra-Americas Sea

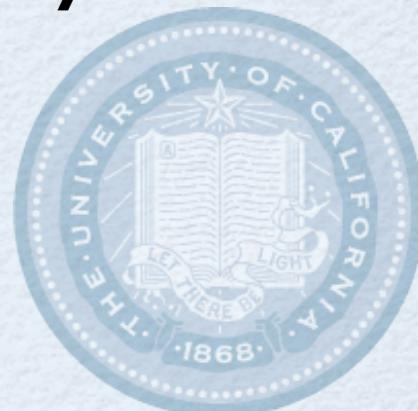

Motivation

- Explore the factors that limit predictability
- Develop Operational 4DVAR System
 - Realtime, ship-board system
- Study the validity of Sverdrup Dynamics w/ high resolution model

Setup

- ROMS version 3
- $1/3^\circ$ assimilation (reduced physics)
 - $1/6^\circ$ forward model
- NCEP Reanalysis + QuikSCAT (R. Milliff) / NCEP GFS
- GLS Vertical Mixing with MY coefficients
- Climatological Boundary Conditions provided by Rutgers North Atlantic Model

Incremental, Strong Approach

- Misfit between model and obs: $\mathbf{d} = \mathbf{y} - H\mathbf{x}^k$

- Assume “close” and minimize this misfit:

$$J_o(\delta x) = \frac{1}{2} (\mathbf{G}R\delta x_0 - \mathbf{d})^T \mathbf{O}^{-1} (\mathbf{G}R\delta x_0 - \mathbf{d})$$

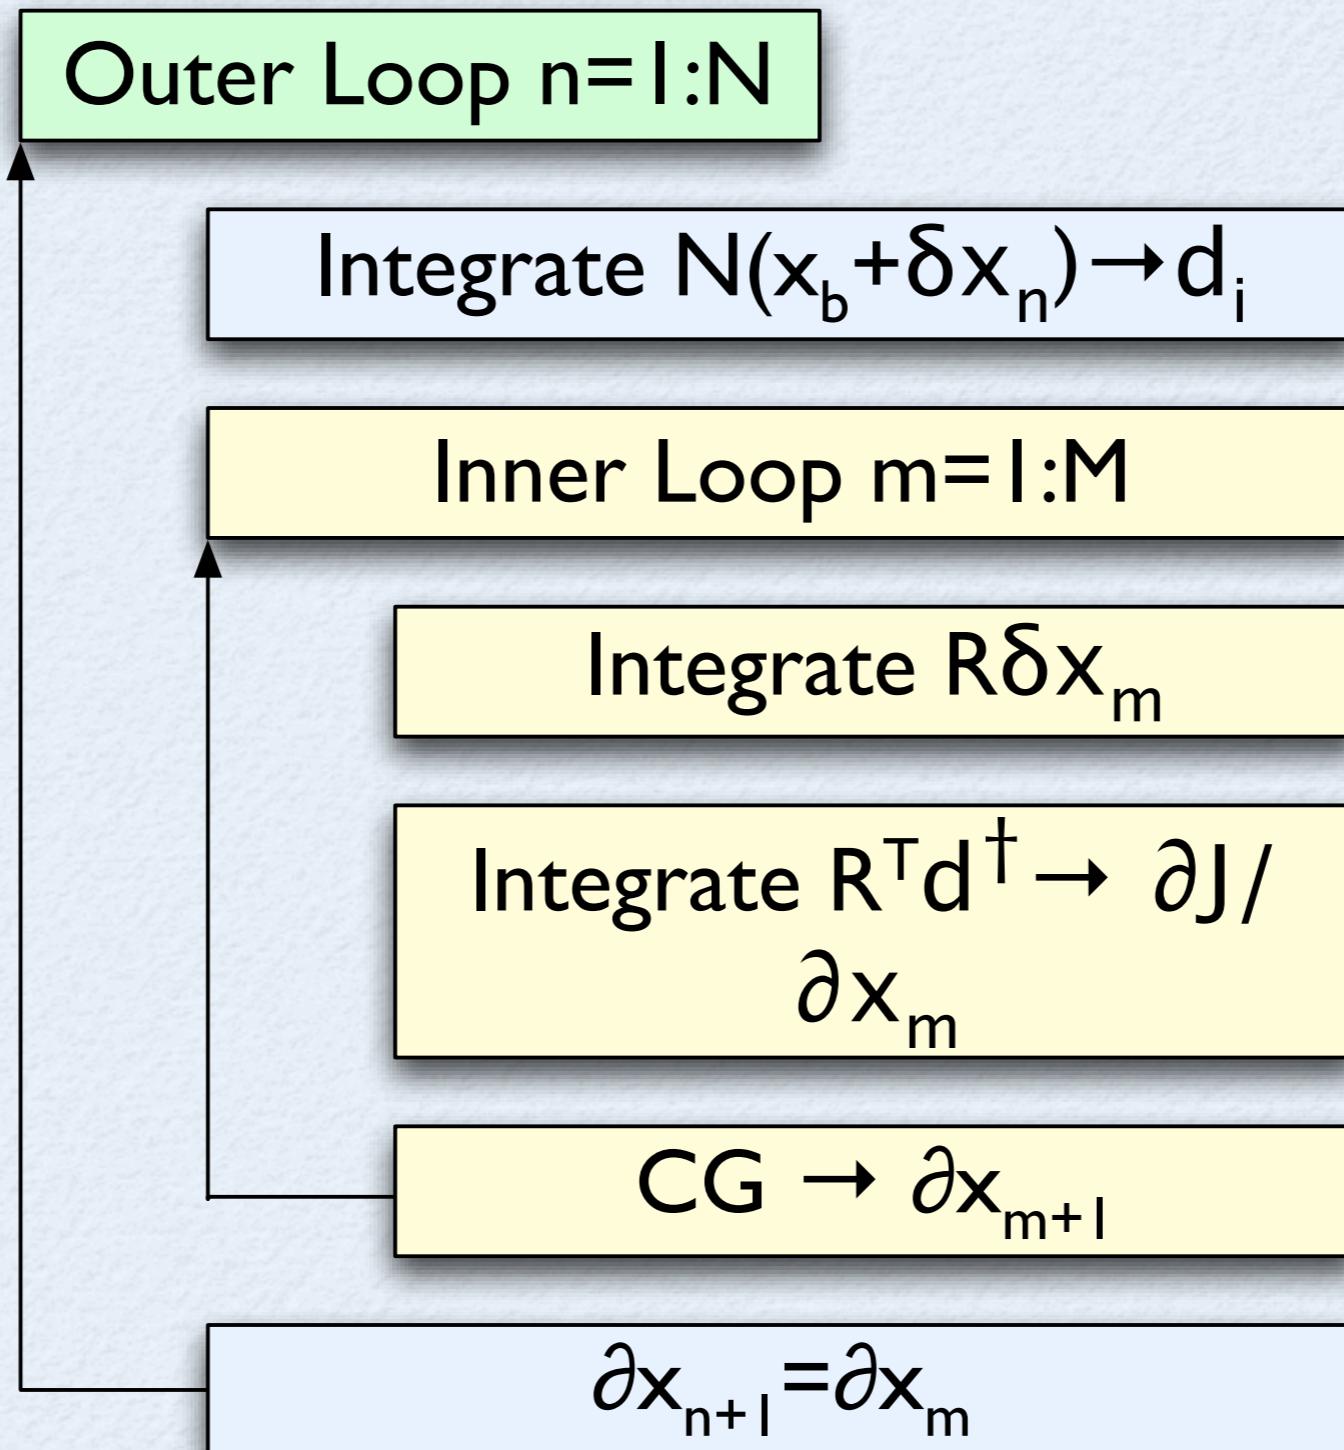

- Simply solve! $\nabla_{\delta x_0} J_o(\delta x) = R^T \mathbf{G}^T \mathbf{O}^{-1} (\mathbf{G}R\delta x_0 - \mathbf{d})$

- Over-determined Case:

$$\begin{aligned} J(\delta x) = & \frac{1}{2} \delta x_0^T \mathbf{B}^{-1} \delta x_0 + \\ & \frac{1}{2} (\mathbf{G}R\delta x_0 - \mathbf{d})^T \mathbf{O}^{-1} (\mathbf{G}R\delta x_0 - \mathbf{d}) \end{aligned}$$

IS4DVAR

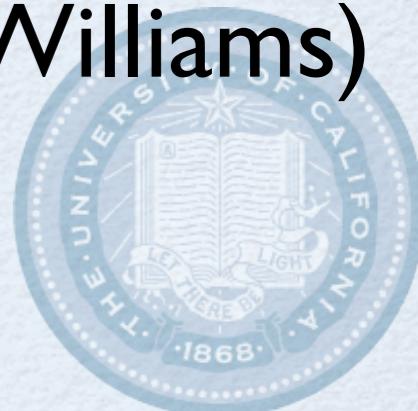

IS4DVAR

- 14 day assimilation: 1 outer, 25 inner loops
- Initial first-guess from 15 year model spin-up
- Unbalanced: $\underline{B} = K_b \Sigma C \Sigma K_b^T$
- 80km horizontal & 100m vertical length scales
- Observation Error Covariance
 - 0.09% of model grid observed over 14 days

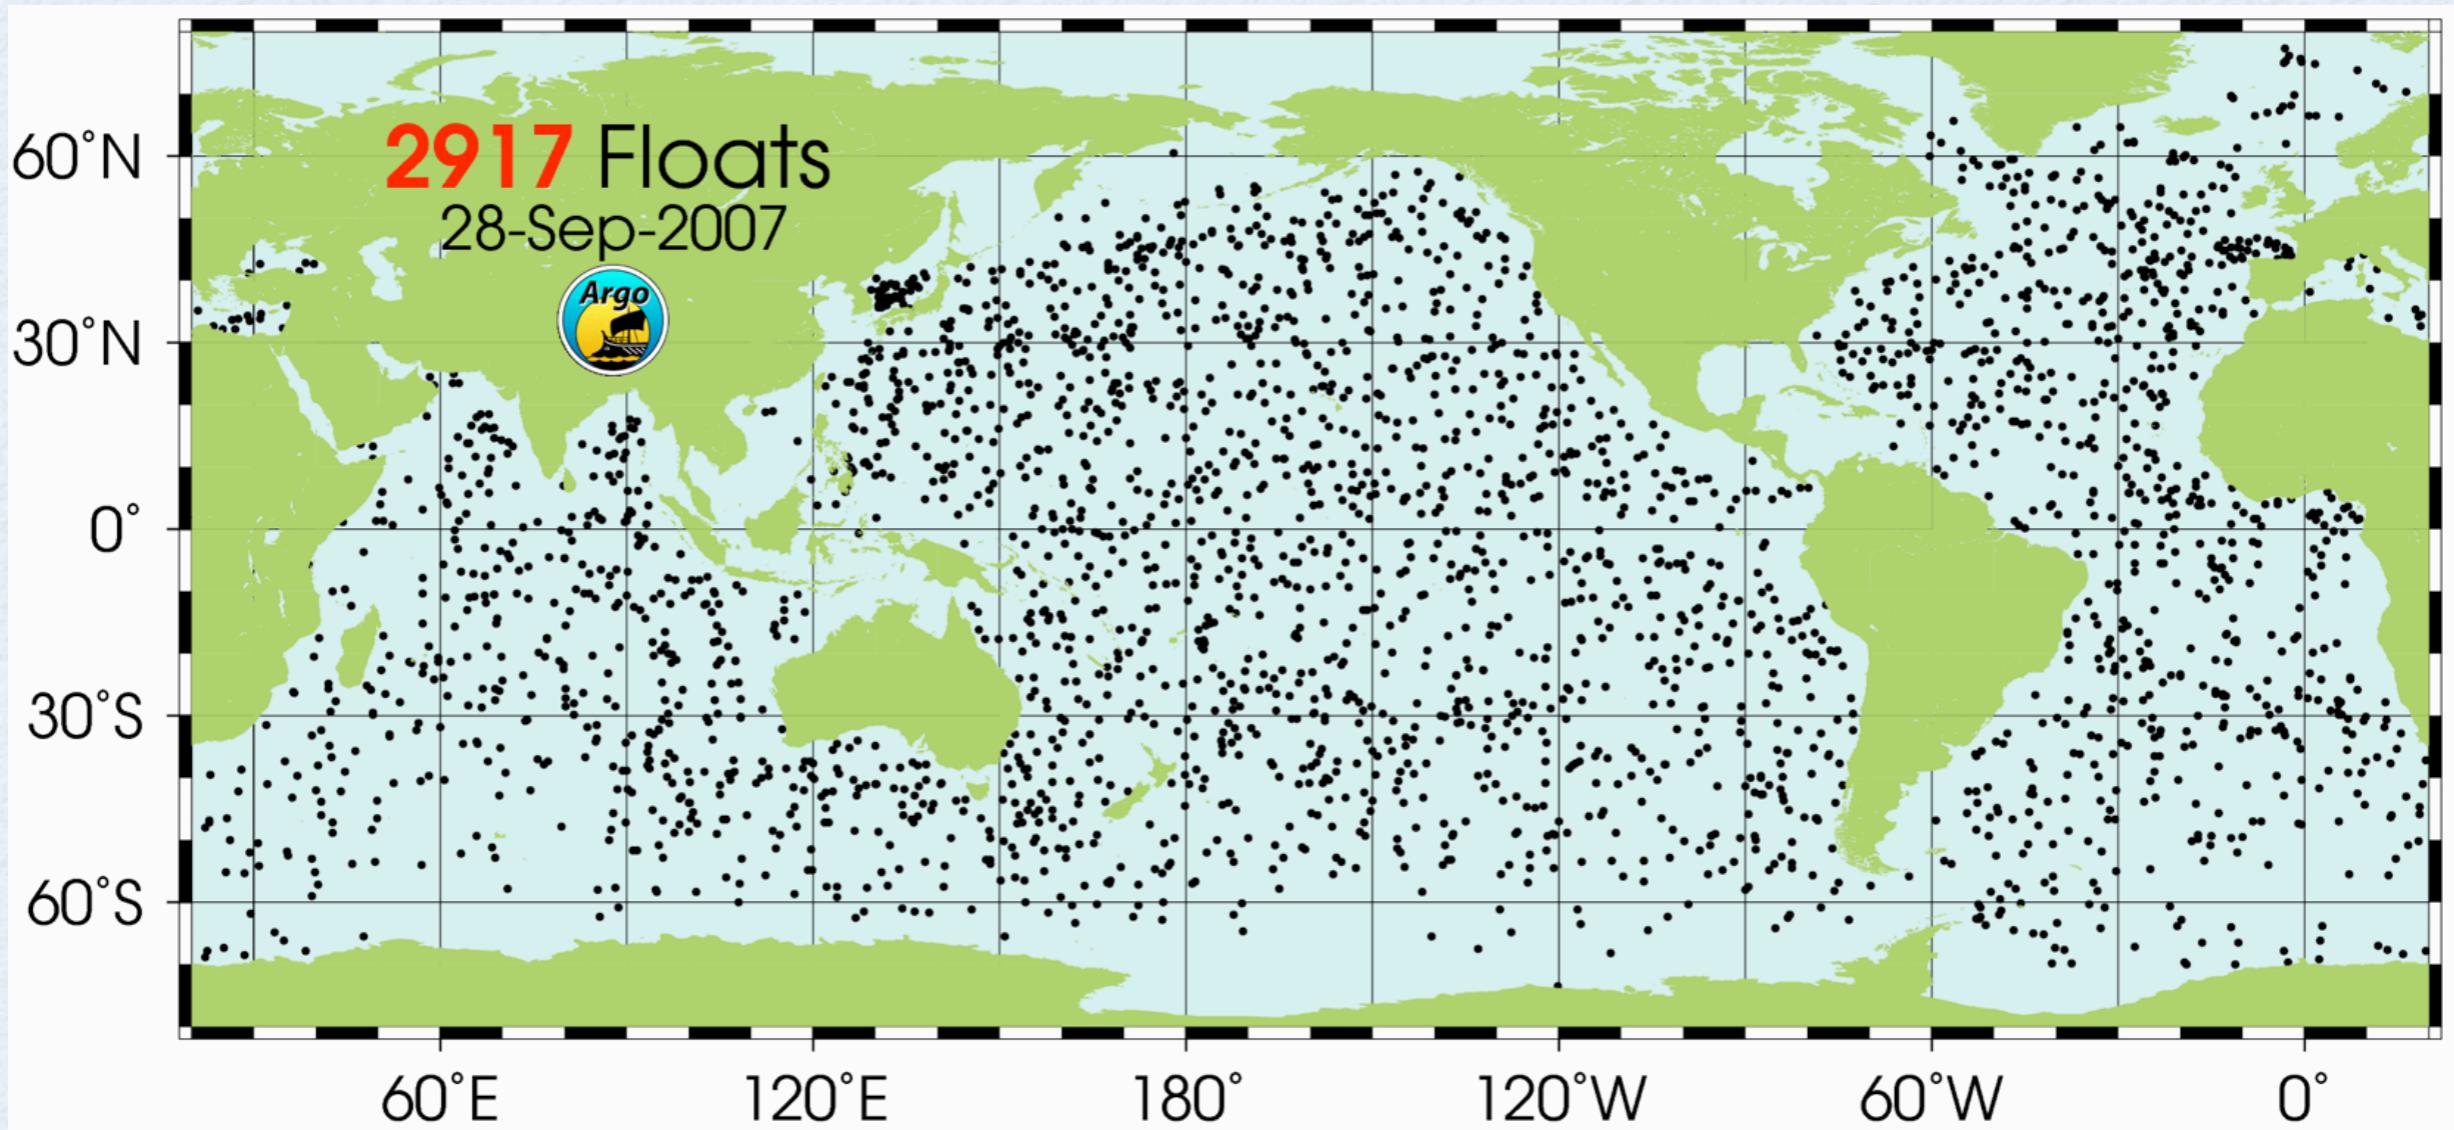

Observational Data

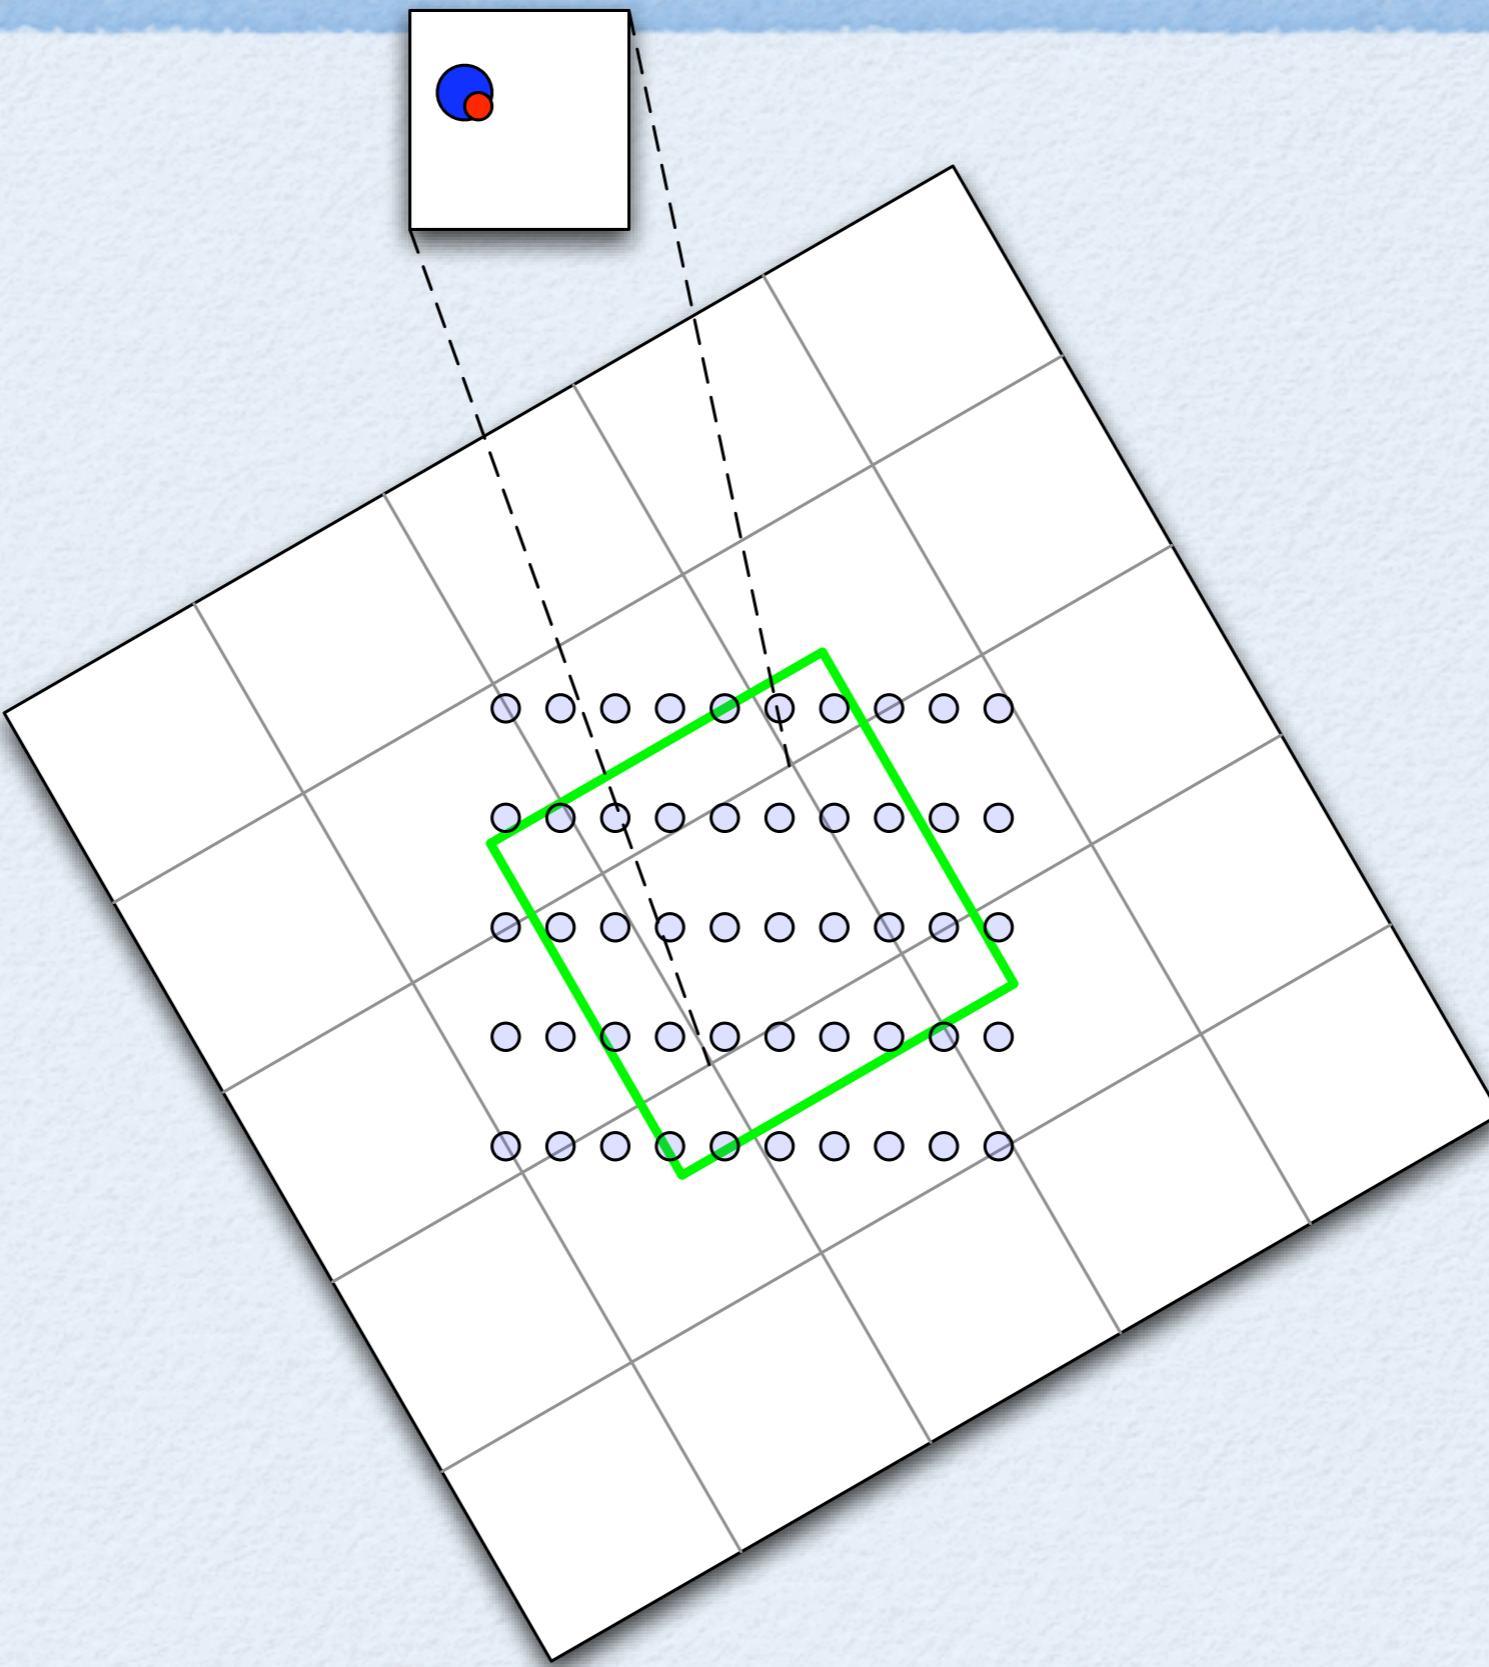

- Historical
 - SSH — Aviso, merged anomalies, (Steric—J. Willis, JPL)
 - SST — D. Foley (PFEL), merged IR/ μ
 - ADCP — *Explorer of the Seas* (Lisa Beal, Liz Williams)
- Realtime
 - SSH — R. Leben (CU/CCAR), (Steric—J. Willis, JPL)
 - SST — UK MetOffice
 - ADCP — *Explorer of the Seas* (Lisa Beal, Liz Williams)

Sampling Issue

“Super” Observations

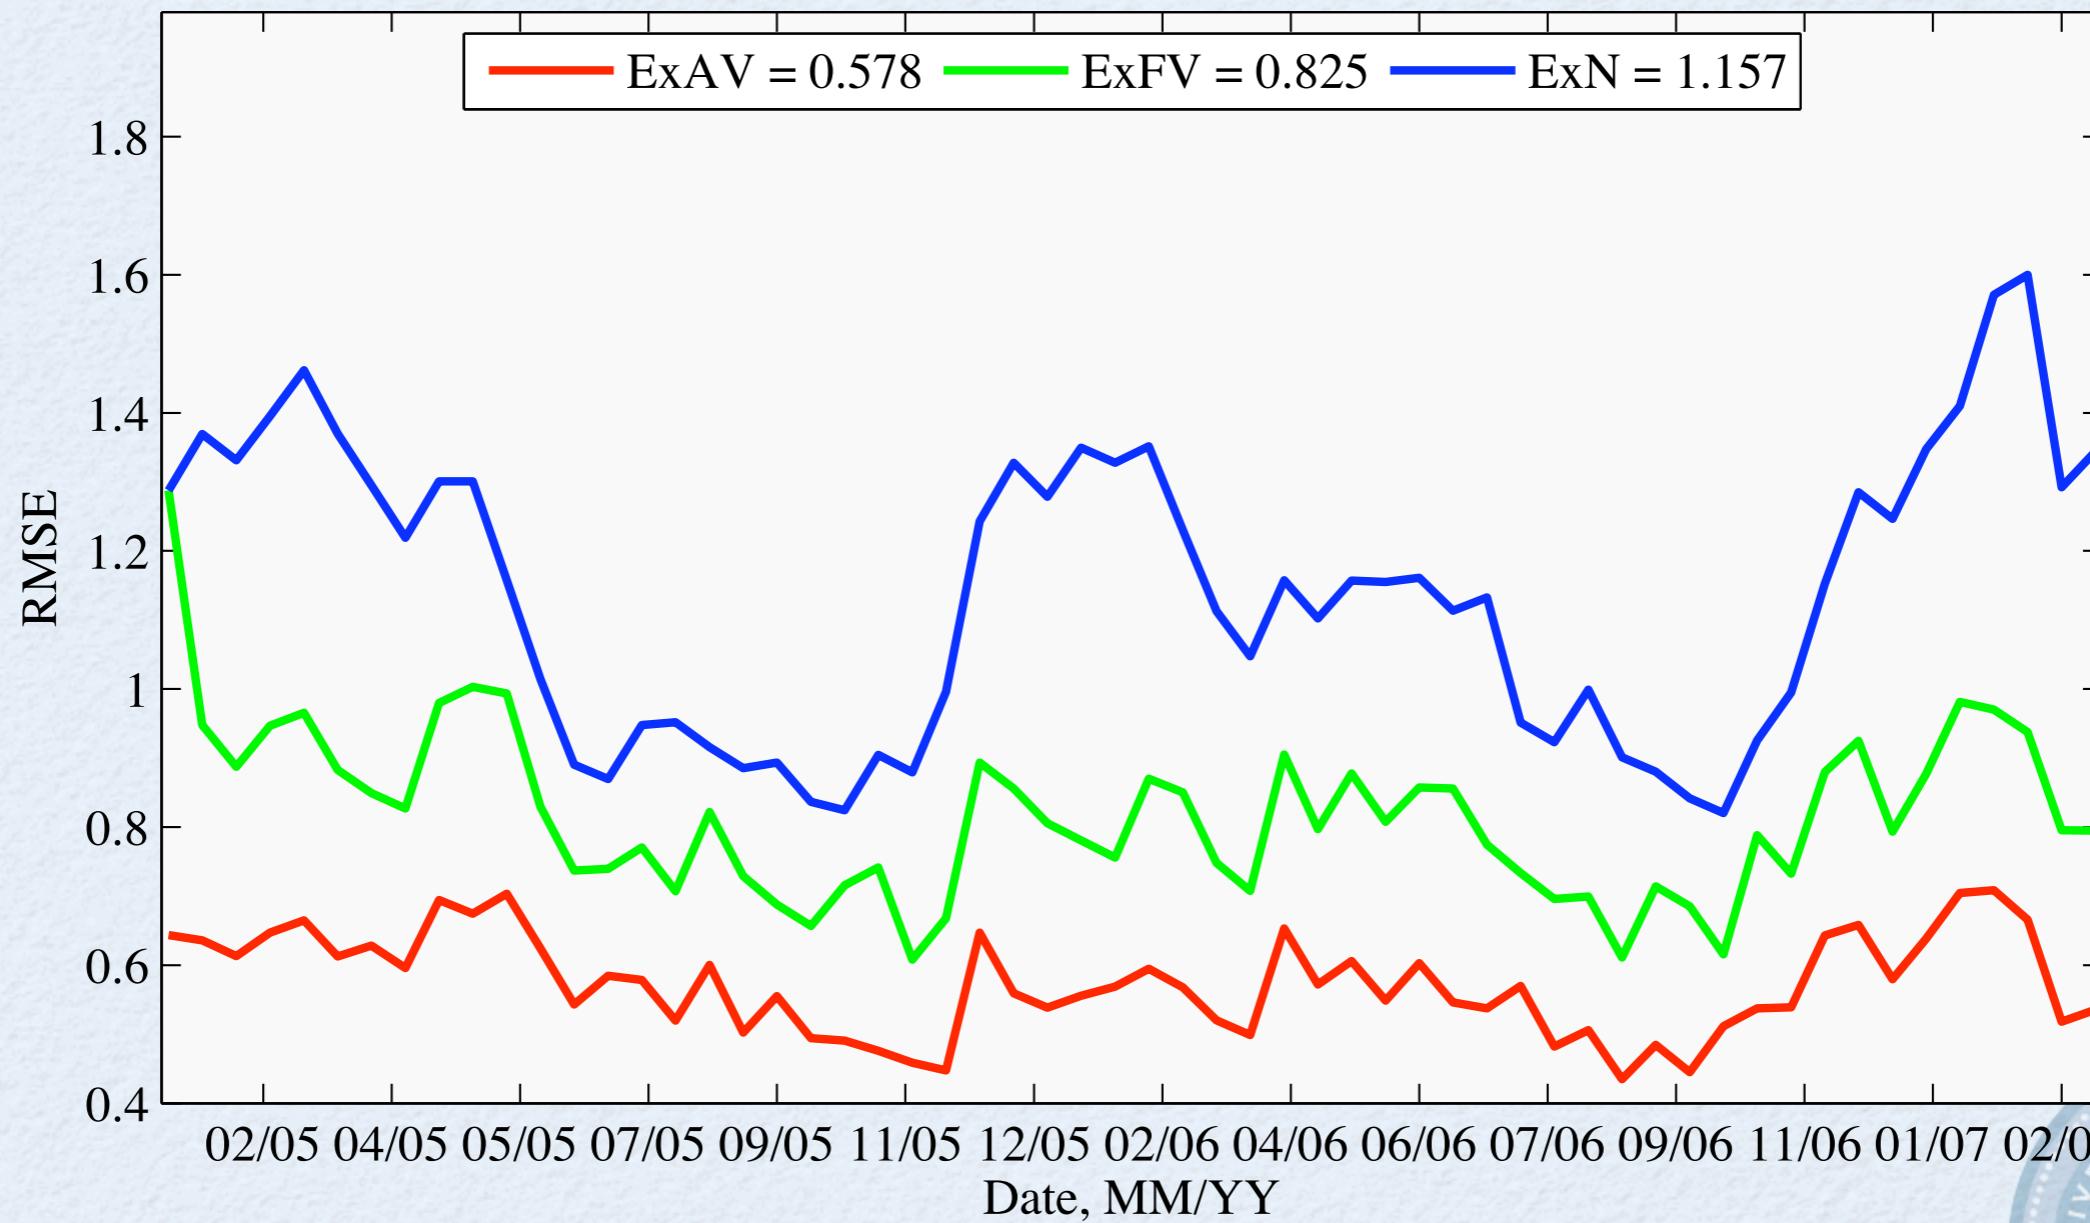

Experiment

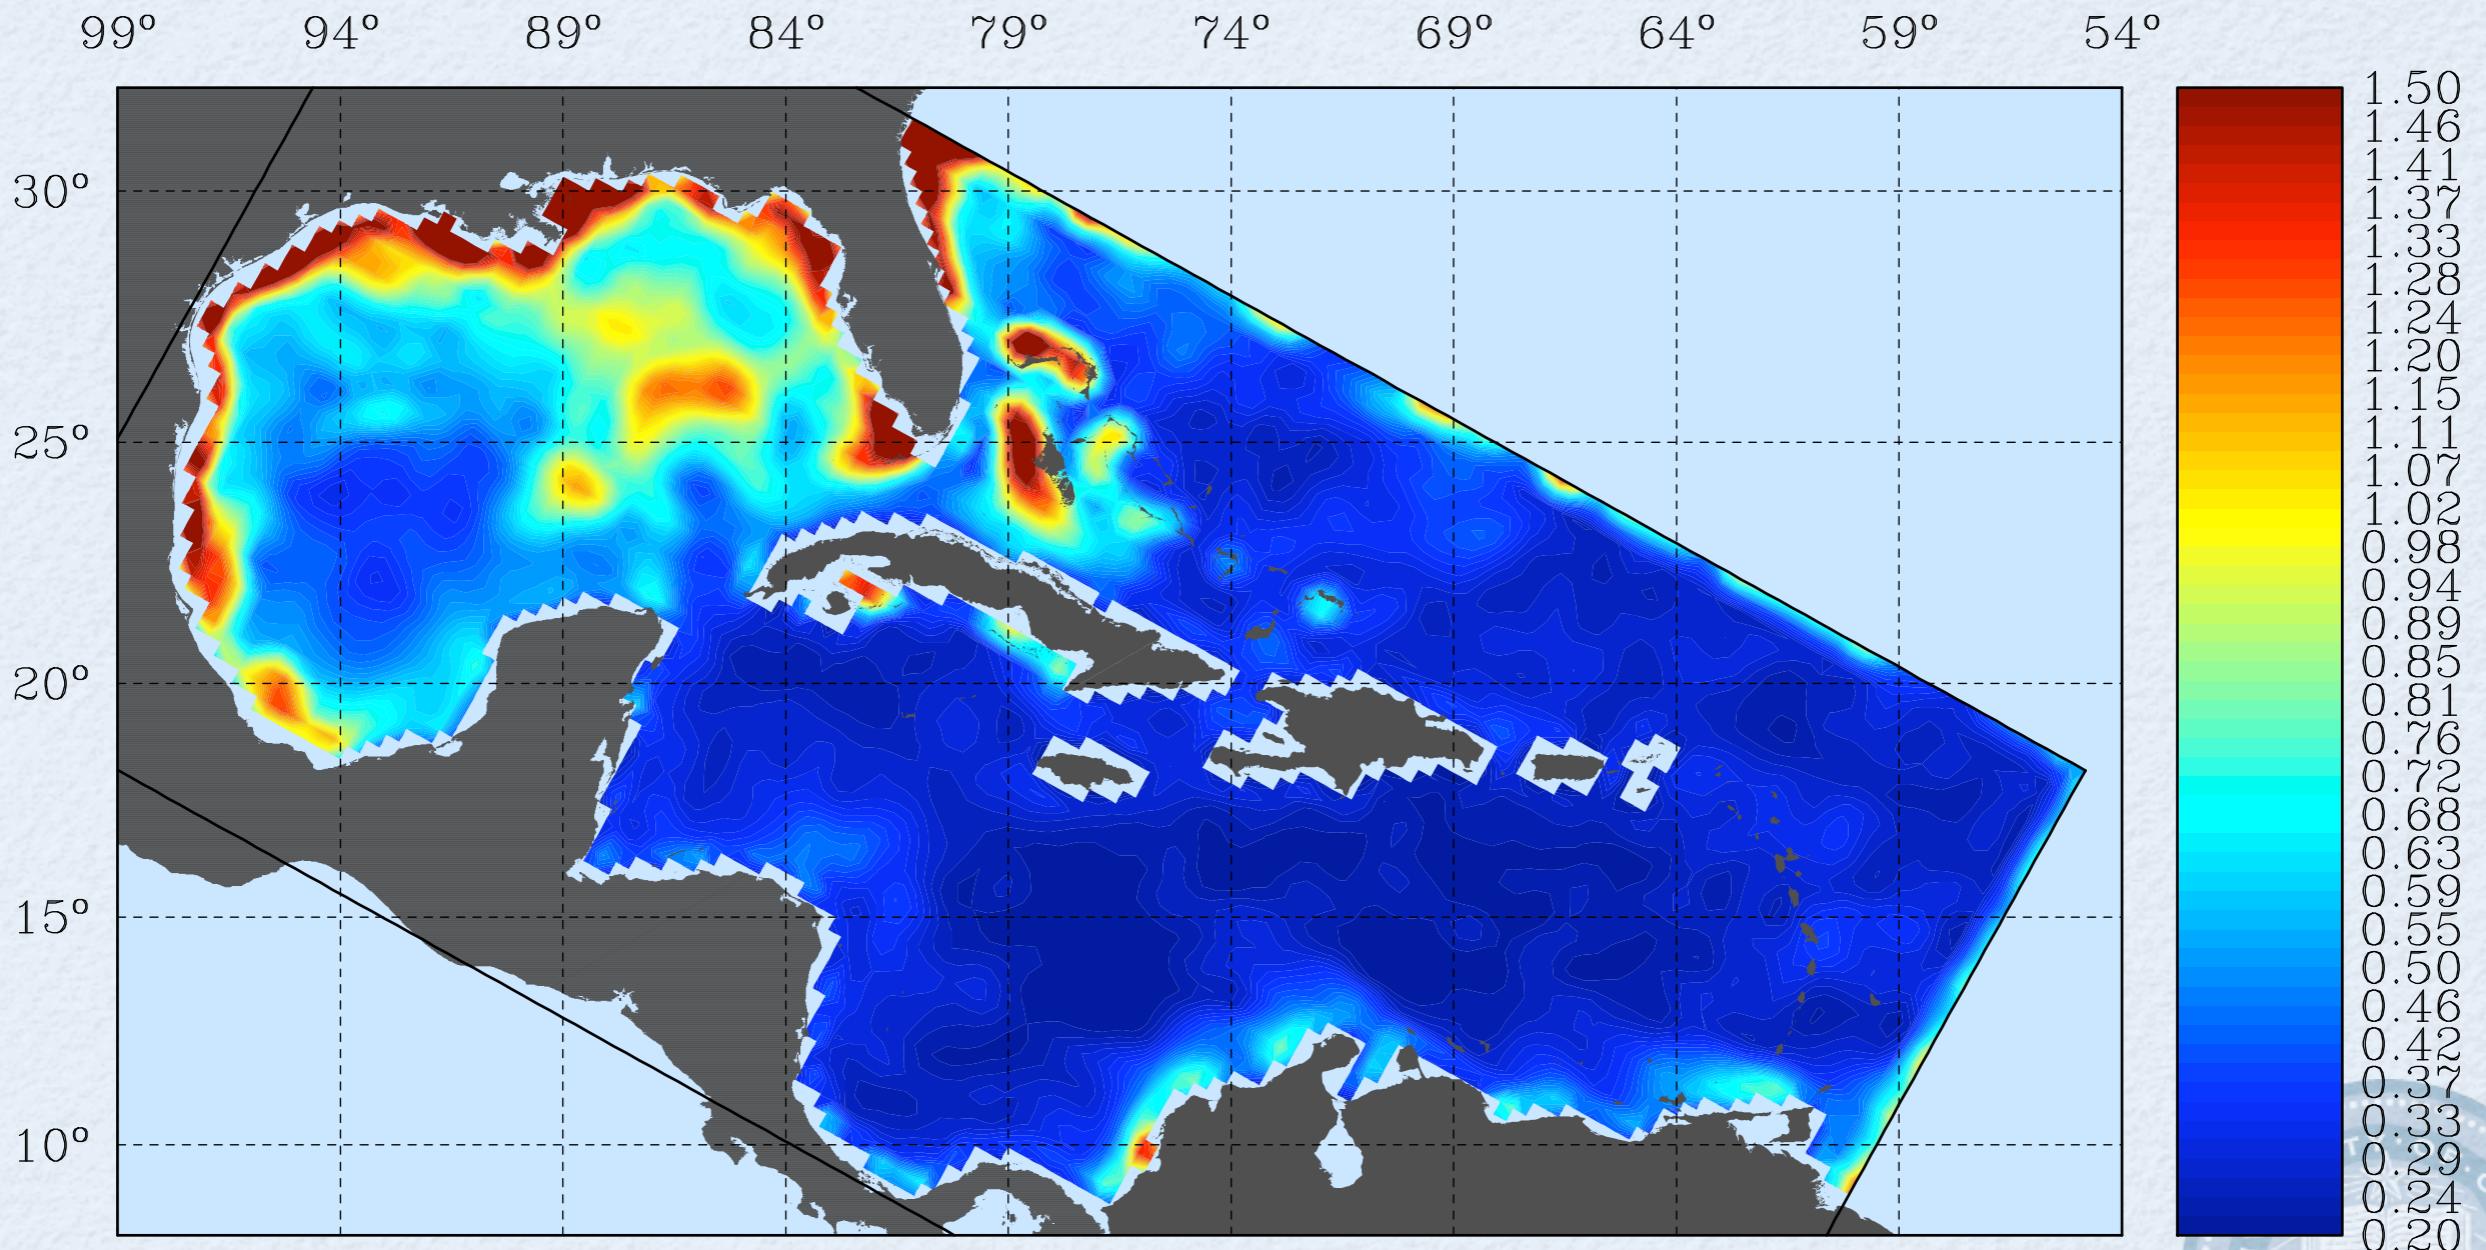

- Historical Spinup From 5 Jan, 2005 until 6 Dec., 2006
- Realtime Data used through Present
- Deployed Jan 7 — 6 weeks of human operation, now fully automated
- Initial first-guess from model spin-up
- Assimilate Previous Day back 7, Forecast 14 days

Loop Current?

Experiment	Max West	Max North	Area (km ²)
Aviso	$88.4^\circ\text{W} \pm 1.6$	$26.3^\circ\text{N} \pm 1.2$	$105,579 \pm 50,000$
No Assim	$87.5^\circ\text{W} \pm 1.9$	$25.0^\circ\text{N} \pm 1.0$	$72,349 \pm 44,159$
Full Assim	$88.8^\circ\text{W} \pm 1.9$	$26.0^\circ\text{N} \pm 1.6$	$104,604 \pm 69,000$

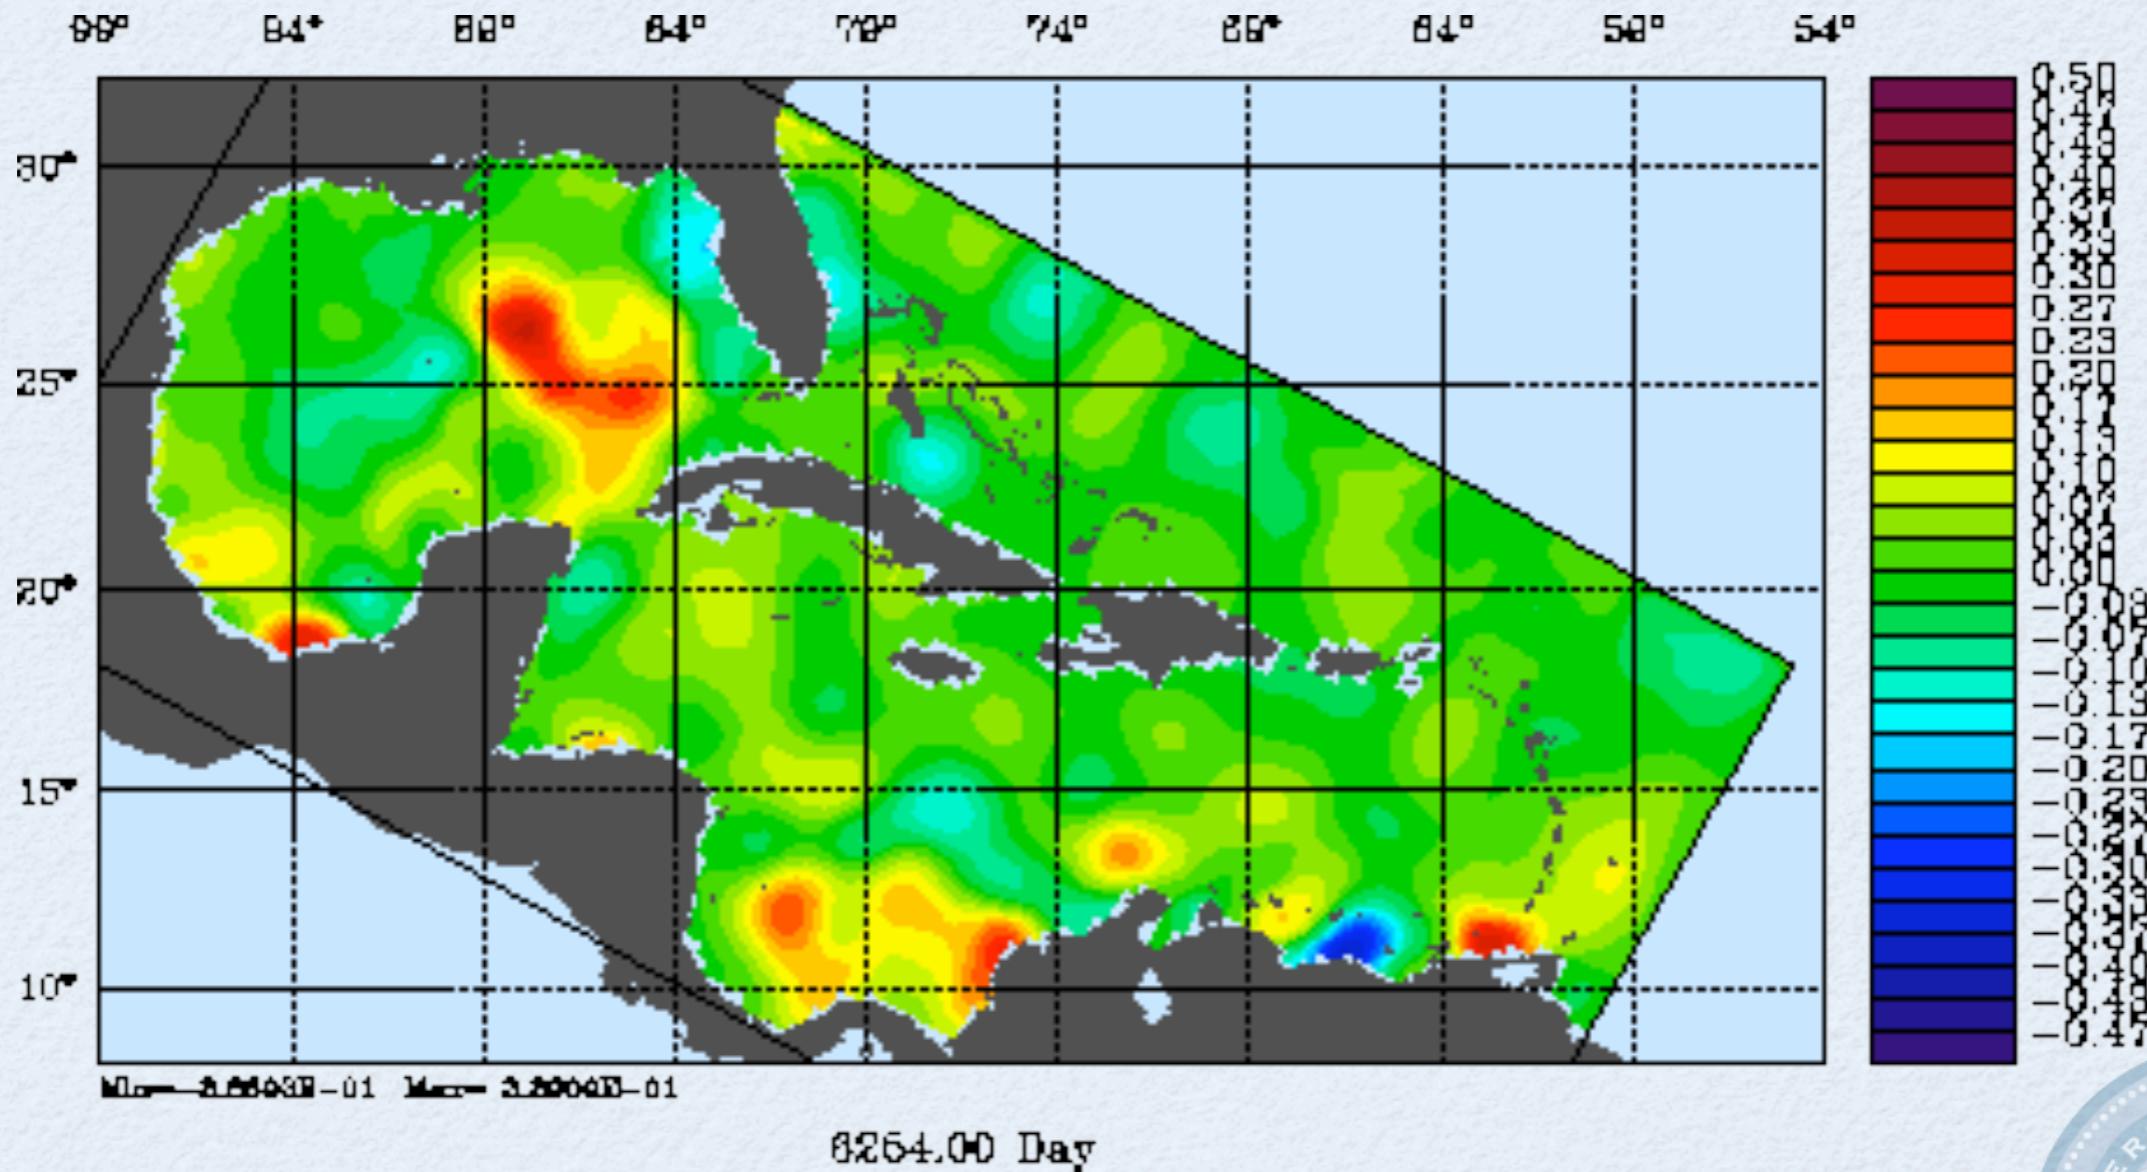

Forecasting

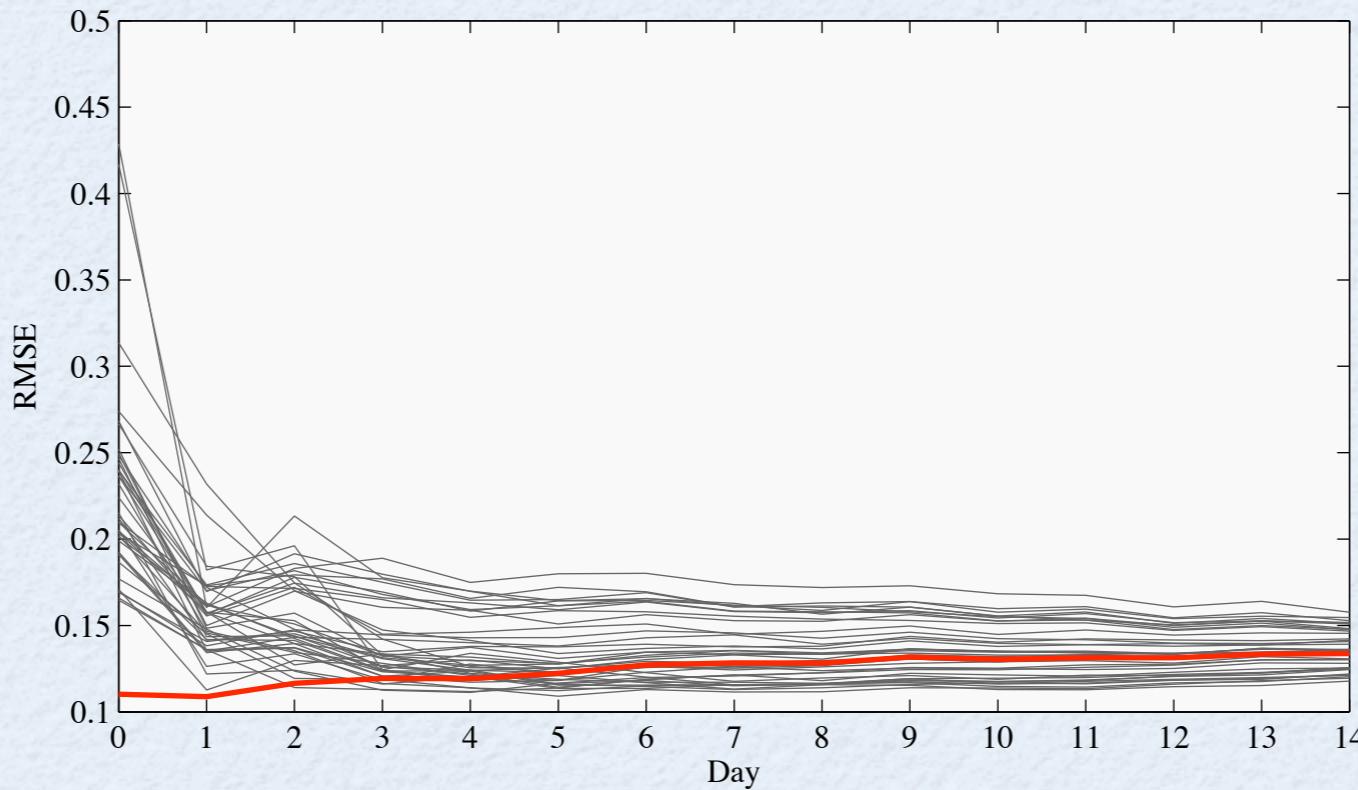

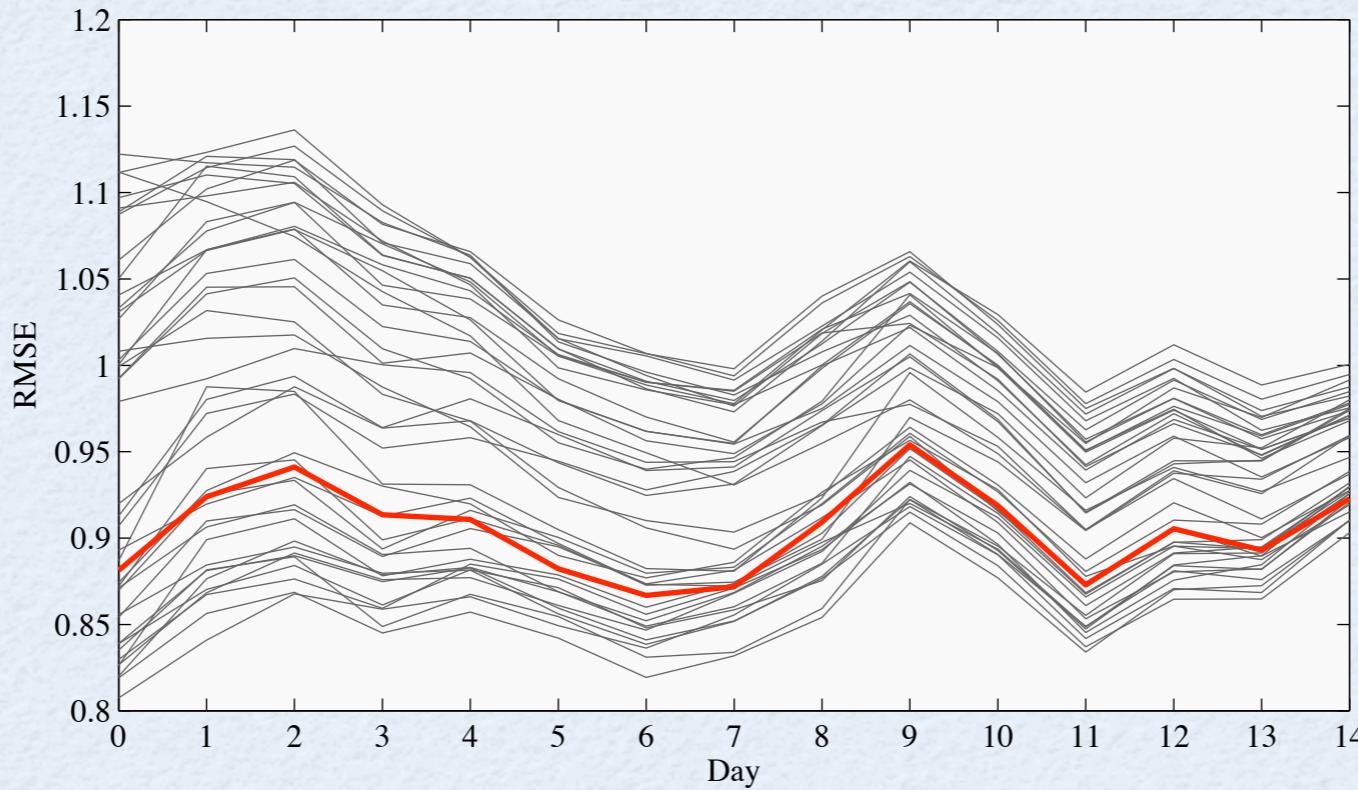

- Use $1/6^\circ$ model for NLM
- Assimilate at $1/3^\circ$
- Orthonormalize increments
- Ensemble Prediction

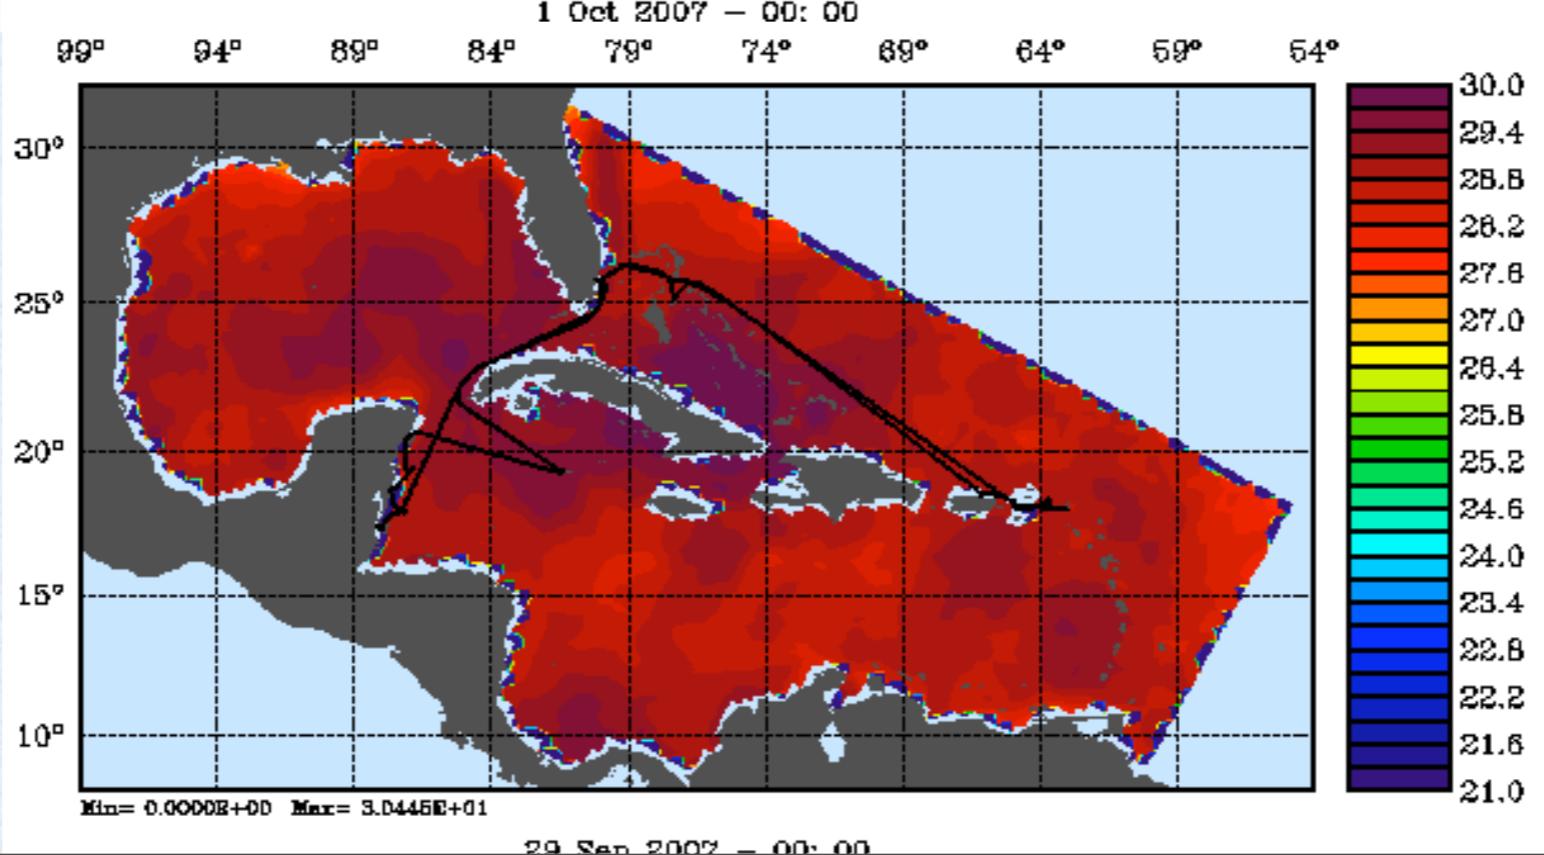

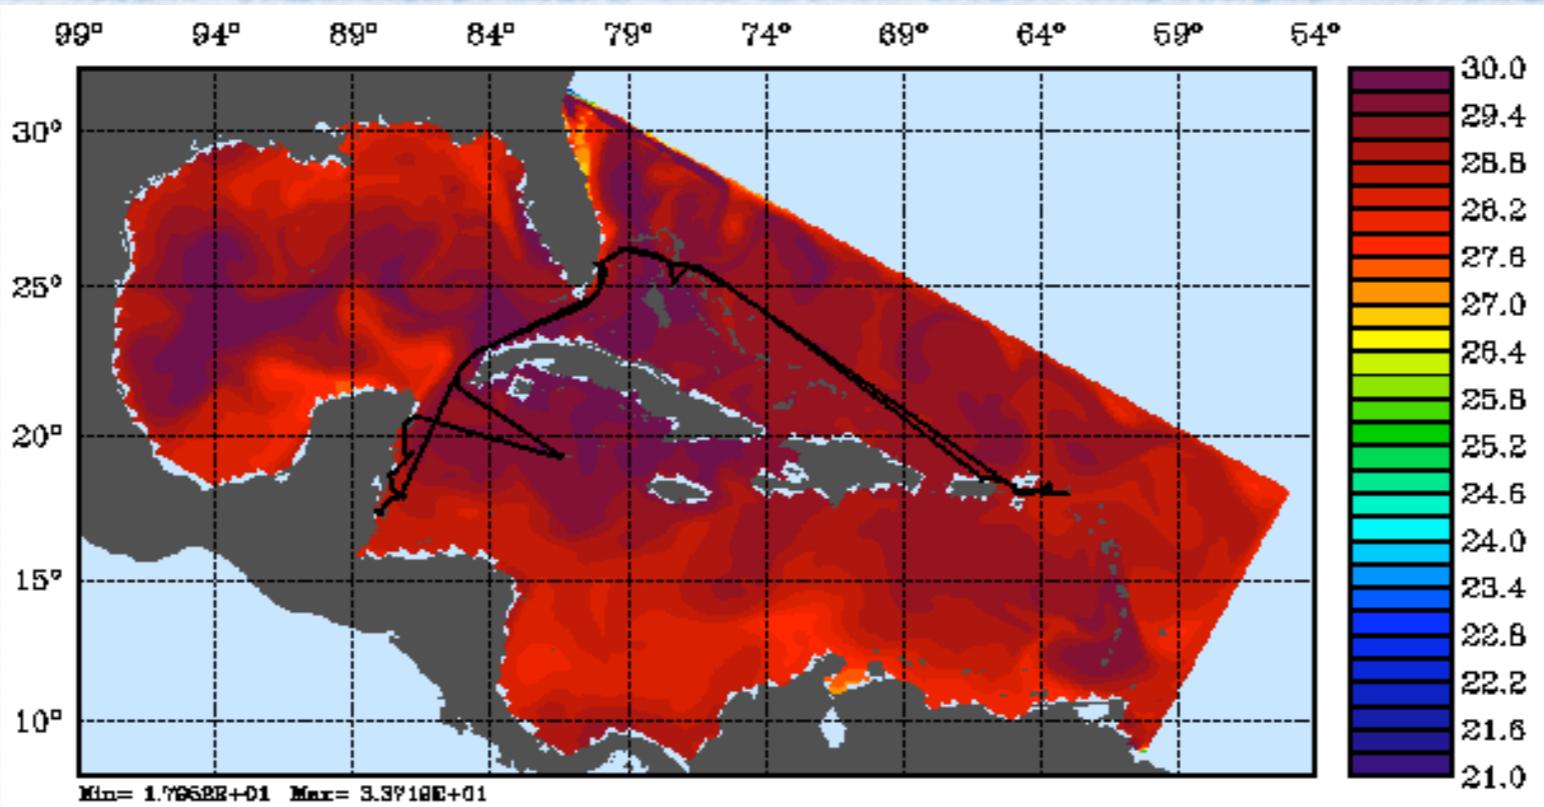

Typical Perturbation

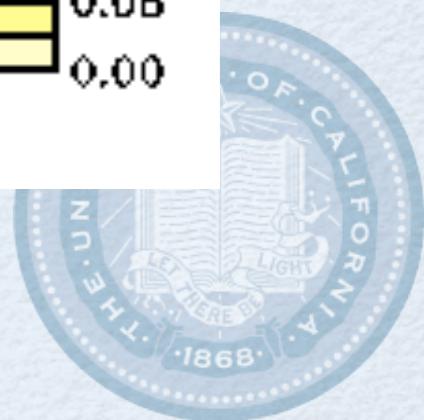

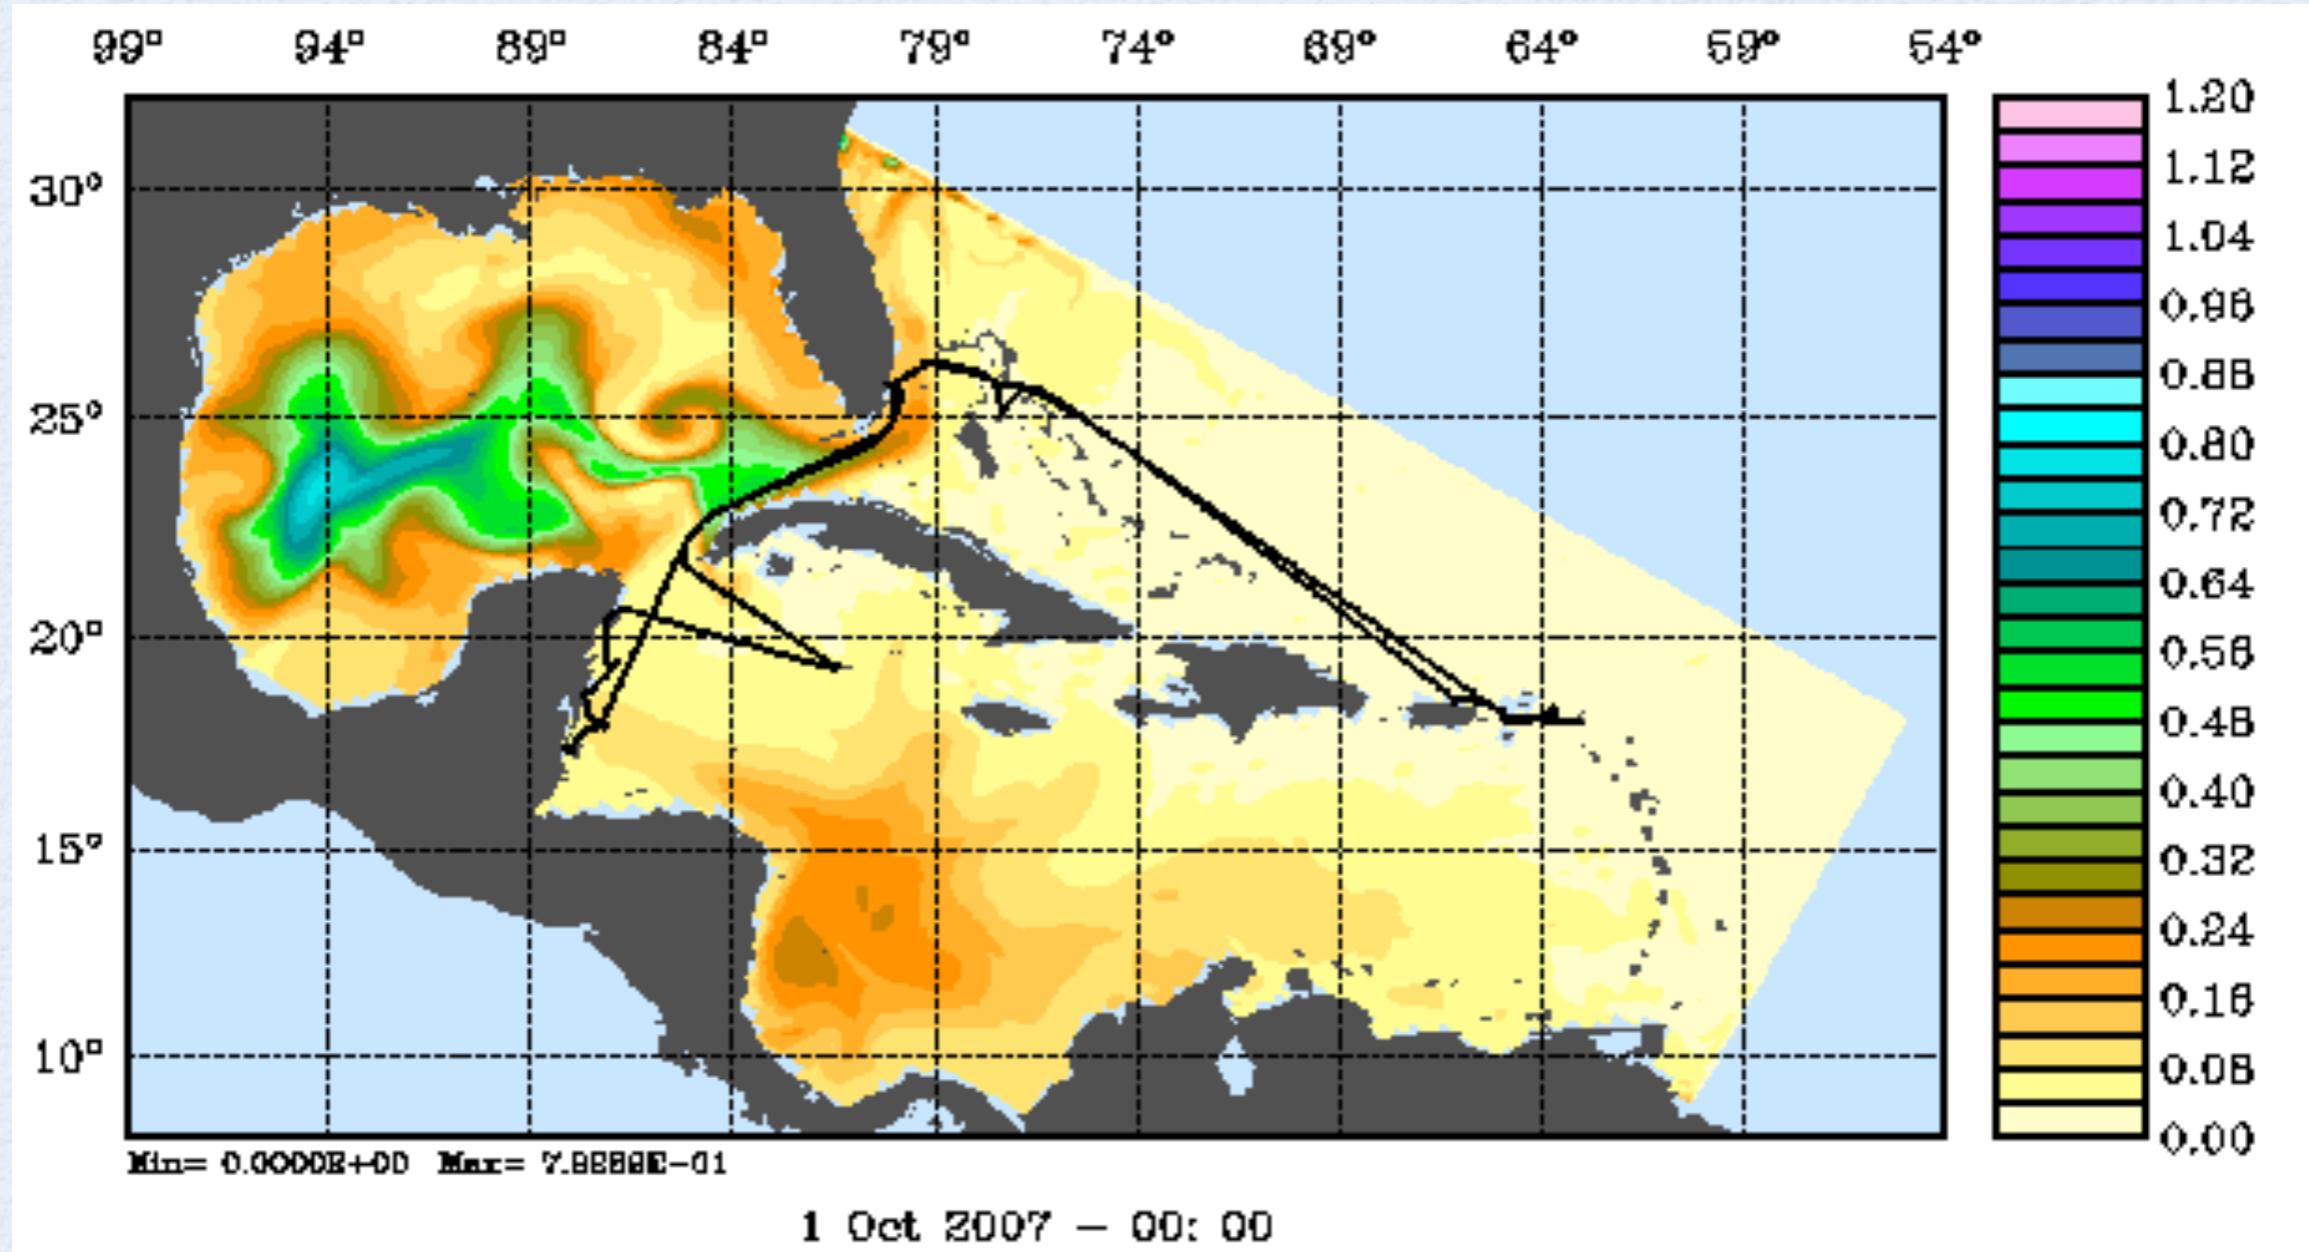

Ensemble Prediction

Current Prediction

Ensemble Variance
